CLIENT

HTTP

HTTP is a client-server protocol. The client sends a request to the server, and the server responds with a response. The request and response are sent over a network connection. The request contains information about the client, the resource being requested, and the method used to request the resource. The response contains information about the server, the resource being requested, and the data returned by the server.

HTTP is a stateless protocol, meaning that the server does not store any information about the client or the request. This makes HTTP scalable and easy to implement. However, it also means that the client must send all the information needed to make a request in each request.

HTTP is a protocol for transferring data between a client and a server over a network. It is a stateless protocol, meaning that the server does not store any information about the client or the request. This makes HTTP scalable and easy to implement. However, it also means that the client must send all the information needed to make a request in each request.
